library(ggplot2)
```

```
## Data

# Call the 4 terminals example

data(package = "blepd")

## trees

data(tree)

str(tree)

## List of 5
## $ edge      : int [1:6, 1:2] 5 6 6 5 7 7 6 1 2 7 ...
## $ edge.length: num [1:6] 1 1 1 1 1 1
## $ Nnode      : int 3
## $ tip.label   : chr [1:4] "t1" "t2" "t3" "t4"
## $ root.edge   : num 1
## - attr(*, "class")= chr "phylo"
## - attr(*, "order")= chr "cladewise"

plot(tree,use.edge.length =T)
```

```
initialTree <- tree
```

```
## distributions
```

```

data(distribution)

str(distribution)

##  int [1:2, 1:4] 1 0 0 1 1 0 0 1
##  - attr(*, "dimnames")=List of 2
##    ..$ : chr [1:2] "A1" "A2"
##    ..$ : chr [1:4] "t1" "t2" "t3" "t4"
dist4taxa <- distribution

## distribution to XY to be able to plot the data, otherwise, skip the next step

distXY <- matrix2XY(dist4taxa)

distXY

##      Terminal Area
## 1      t1      A1
## 2      t3      A1
## 3      t2      A2
## 4      t4      A2

## plotting

## the tree

plotTree <- ggtree(initialTree, ladderize=TRUE,
                    color="black", size=0.5, linetype="dotted") +
  geom_tiplab(size=6, color="black") +
  theme_tree2() +
  ggtitle("Four terminals, equal branch length")

##
print(plotTree)

```

Four terminals, equal branch length

```
## the distribution

plotDistrib <- ggplot(data=distXY,
                      aes(x= Area, y= Terminal , size =150)) +
  geom_point() +
  theme_bw() +
  theme( axis.text.y = element_blank(),
        panel.grid.major = element_blank(), # Remove major gridlines
        panel.grid.minor = element_blank(), # Remove minor gridlines
        axis.line = element_line(colour = NA_character_), # Remove axis lines
        axis.ticks = element_blank(), # Remove axis ticks
        legend.position = "none"
  ) +
  labs(title = "Distributions",
       y = "",
       x = "Area")

##
print(plotDistrib)
```

Distributions

```
cowplot::plot_grid(plotTree, plotDistrib, ncol=2)
```

Four terminals, equal branch length

Distributions

We check whether names in both objects: initialTree and dist4taxa, are the same.

```
##all(colnames(dist4taxa) == initialTree$tip.label)

all(colnames(dist4taxa) %in% initialTree$tip.label)
```

```
## [1] TRUE
```

We report the branch length, and calculate the PD values.

```
initialTree$edge.length
```

```
## [1] 1 1 1 1 1 1
```

```
initialPD <- PDindex(tree=initialTree, distribution = dist4taxa)
```

```
initialPD
```

```
## [1] 4 4
```

As expected there is a tie between both areas.

Now, we can see the impact of the possible null model(s), we will use the three available models to swap: “simpleswap”, “allswap”, “uniform”, and we will swap the three classes of branches: “terminals”, “internals”, “all”.

?swapBL

```
for( modelo in c("simpleswap", "allswap", "uniform") ){

  for( rama in c("terminals", "internals", "all") ){
```

```

        val <- swapBL(tree=initialTree,
                      distribution = dist4taxa,
                      model = modelo,
                      branch = rama
                      )

        cat( "\n\t Model=\t\t",modelo,
              "\n\t Branchs swapped=\t",rama,"\n" )

        printBlepd(val)

        cat( "\n\n\n" )

    }

}

```

```

## model to test simpleswap reps 100

```

As expected, as all braches are EQUAL nothing happens

Now, let us see if the results could be assigned to the longest branches (or not).

```
## this is?
## source("/home/rafael/disco2/proyectosDRME/indices/blepd/docs/print00.r")
```

```
## we could use a single command (*evalBranch*)
```

```
?evalBranch
```

```
AllTerminals <- evalBranch(tree=initialTree,
                           distribution = dist4taxa,
                           branchToEval="terminals",
                           approach="all")
```

```
